# Cooler Line Highlights

Welcome to the world of transmission and engine oil cooler lines. Here are the most critical pieces of information in understanding this category!

## Identifying Your Cooler Line

Transmission oil cooler lines are typically routed along the **passenger** side of the vehicle under the hood. Leaking fluid will be red.

Engine oil cooler lines are typically routed along the **driver** side of the vehicle under the hood. Leaking fluid will be brown or black.

## Terminology in This Catalog

**UPPER** — Assembly is physically routed into radiator at the higher position.

**LOWER** — Assembly is physically routed into radiator at the lower position.

**INLET** — Assembly carries flow of oil **IN** to cooler from engine.

**OUTLET** — Assembly carries flow of oil **OUT** of cooler into engine.

Some nomenclature, like below is listed to help you match part numbers listed in our application section with the location of an assembly on the vehicle.

**DRIVER SIDE** — Assembly connects to cooler on driver side of vehicle.

**PASSENGER SIDE** — Assembly connects to cooler on passenger side of vehicle.

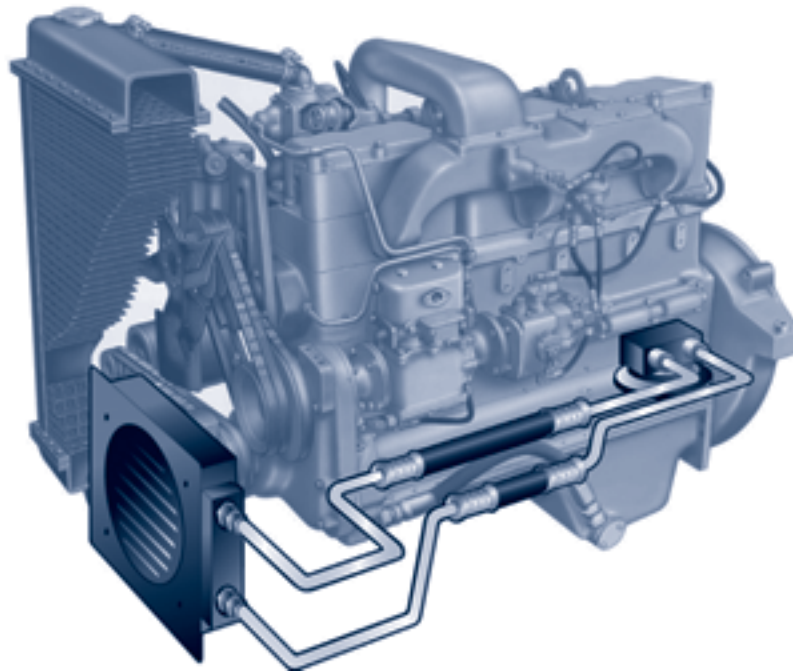

The information found on pages A10-A11 is also available as a handy installer tech-tip wall poster. Ask your sales representative about this piece (PE-0068).

## Using This Catalog

While there is a great deal of information in this catalog, it is only useful if you understand how to identify the hose assembly you need and verify it.

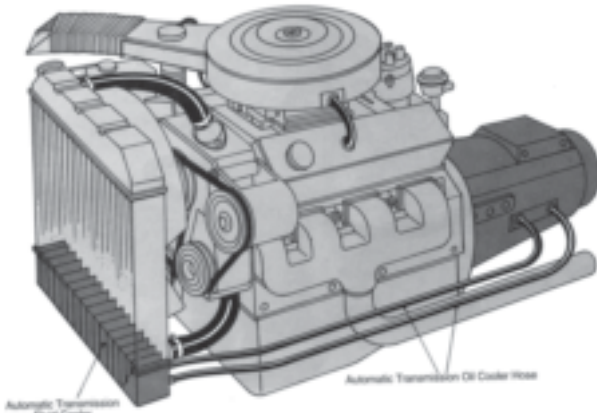

- Identify hose part number by application given in application section.  
(Make/Model/Year/Engine Size/Qualifiers)
- Verify hose by illustration section with digital image.
- Confirm hose by OEM number (if available on original hose) in our Manufacturers' Part Numbers Section

## *Typical Engine with Engine Oil Cooler Lines*

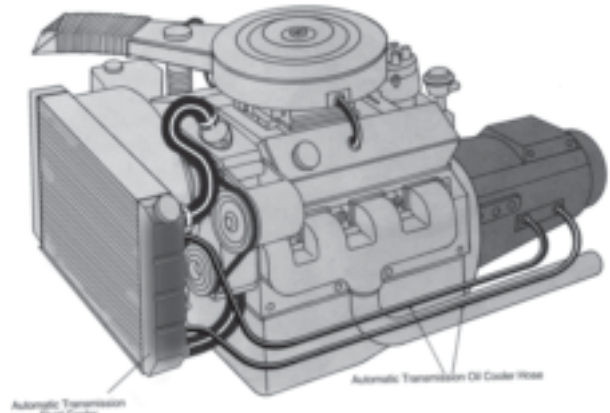

- Engine oil cooler lines are found on many late-model light trucks, vans, SUVs and vehicles with tow packages.
- The primary function of engine oil cooler lines is to carry hot engine oil away from the engine to an external cooler typically located in front of or around the radiator. The oil is cooled, then cycled back to the engine through an outlet hose.
- The external cooler associated with these lines is typically located in front of the radiator.
- When replacing other engine components, do not contaminate the new engine oil and system by reinstalling old cooler lines. Hoses will break down internally over time from heat, and trapped particles can cycle through the system causing further damage.

## Transmission Oil Cooler Assemblies OEM Fit and Performance

**Down-Flow Radiator**

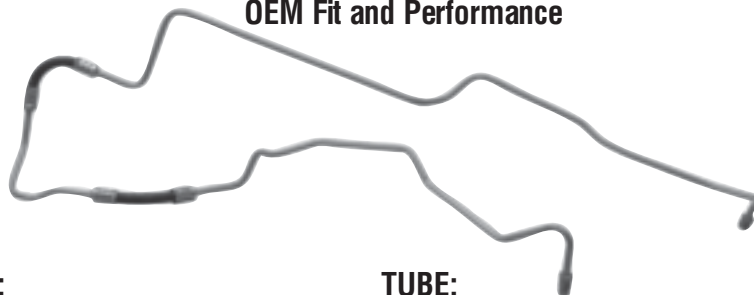

**Cross-Flow Radiator**

### **Until now, the only source for replacing Transmission Cooler Lines was the OE Dealership.**

- With the complexities of today's vehicles, it is always recommended that you replace a transmission oil cooler line with a new assembly that follows the original equipment design. OE-designed assemblies allow the automatic transmission fluid (ATF) to cool down during the cycle of the fluid. "Quick Fix" or short-cutting repairs can greatly reduce ATF life and could compromise the transmission. A new transmission can cost over \$2,000 to replace.
- Automatic transmission fluid cools by traveling out of the transmission via the oil cooler line to a reservoir in the radiator. The cooled fluid from the radiator dissipates the ATF heat and is then returned to the transmission for another cycle. In a down-flow radiator, the transmission oil cooler is located in the bottom portion of the radiator. In a cross-flow radiator, the transmission oil cooler is located in the side of the radiator.
- Transmission oil cooler assemblies consist of metal tubing or an assembly of metal tubing and rubber hose. Transmission oil cooler hose is used to absorb engine and road vibration.
- While ATF was designed to operate at temperatures of 175°F, the reality is that transmission and cooling lines are routinely subjected to conditions that cause it to operate at 220°F or more, up to 300°F intermittent. As the heat goes up, assembly life goes down.
- Transmission cooler lines are also subjected to high pressure. On older vehicles, 75 to 150 psi is standard. Surges up to 300 psi can be seen on newer electronically controlled transmissions. A small leak under these pressures can lead to serious problems.

## Installer Repair Problems

Engine cavitations, road vibration and reduced underhood space can have an effect on your hydraulic hoses.

- Improperly routed assemblies can frequently be pinched or kinked against the frame or other hard parts causing premature failure.
- Additionally, heat dissipation is critical to the longevity of the assembly and can be greatly reduced by shortening the assembly or not using the correct length of tubing.

Edelmann design and materials ensure that your customer will not experience these problems when you fix their vehicle with Edelmann Engine and Transmission Oil Cooler Lines.

As with power steering, we have paid close attention to:

- Duplicating the original routing
- OEM-style fittings
- Safety features
- Methods of assembly

We use only quality materials in the manufacturing of all our Oil Cooler Lines for years of trouble-free driving:

- Rubber hose meets or exceeds OEM specifications to withstand the high heat under-the-hood of today's vehicles
- Zinc-coated steel tubes protect against rust and corrosion

We carefully study what the OEM puts on the vehicle to make sure that what you get matches the original in form, fit and function.

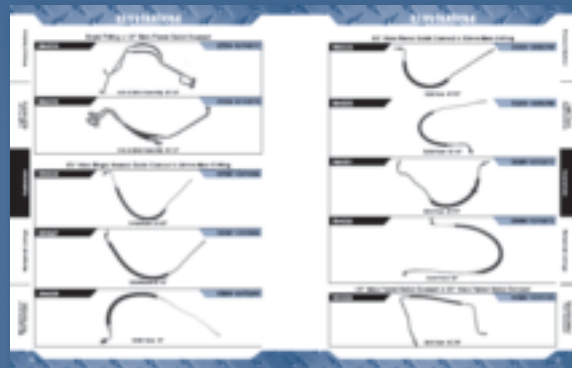

We want to make sure that when it goes out your door, it doesn't come back!

We have criss-crossed the country talking to repair shop professionals, like yourself. We have identified the most failure prone vehicles in this category as:

EOC - Late model Chevy/GMC Blazers, Jimmys, pickups, Astro vans, Suburbans and Yukons.

TOC - Late model Dodge trucks, Chrysler mini-vans and GM front-wheel drives.

We covered not only these applications, but many more. Edelmann offers you the ability to say "yes" to your customer every time.

Our catalog research goes through rigorous filters and checks to bring you the exact information you need in an easy format.

Electronic rollouts happen six times a year to continuously bring you up-to-date coverage on new assemblies!

A hallmark of our power steering line offering has been to continuously add new coverage to meet the growing needs of the market. We are supporting our Oil Cooler Lines with the same diligence.

# AVAILABILITY

# SAVINGS

Until now, your best source for Oil Cooler Lines was the dealership. But dealerships haven't always stocked the model year coverage you require. Now, we manufacture and are making available to you the hard-to-find parts that you need.

Edelmann has the availability on older vehicles giving you those hard-to-find parts in addition to the many fittings, seals and other parts that should be replaced when you do a repair.

In many cases, not replacing O-rings, seals, clips, brackets, etc. can lead your customer right back to you.

Edelmann directly services thousands of customers and has products distributed through tens of thousands of warehouses and jobbers in all 50 states, Canada, Mexico, Puerto Rico and across the globe.

Our distribution network ensures that our product will be available through the local distribution partner you have come to know and trust.

- Edelmann coverage means you will save time by not having to search around town for hard-to-find parts.
- Edelmann availability means you will save the sale by knowing the part will be available the same day. You will know who to put at the top of your speed dial.
- Edelmann hydraulic lines are competitively priced against the OEM dealerships enabling you to improve profit on the parts that you buy.

# WHICH LINE

## TRANSMISSION OIL COOLER LINE

Transmission oil cooler lines are typically 5'-6' in length

Female quick connect fittings can only be found on transmission oil cooler lines

### Installation Tips

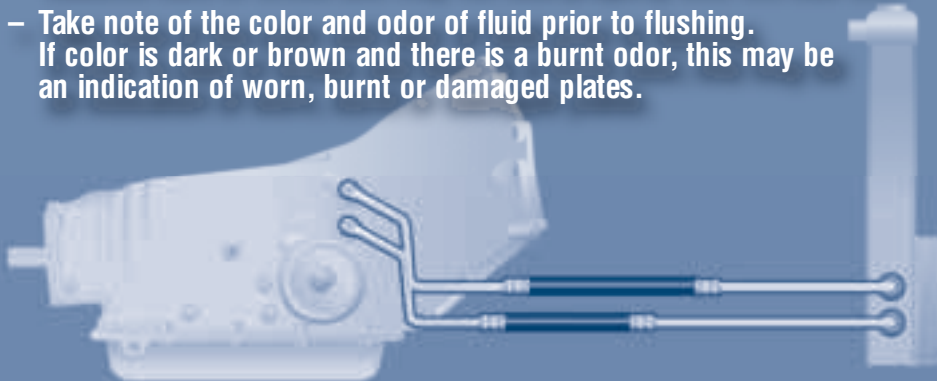

Hose diameter is typically 5/16" or 3/8"

### TOC – Transmission Oil Cooler Lines

#### • When Changing:

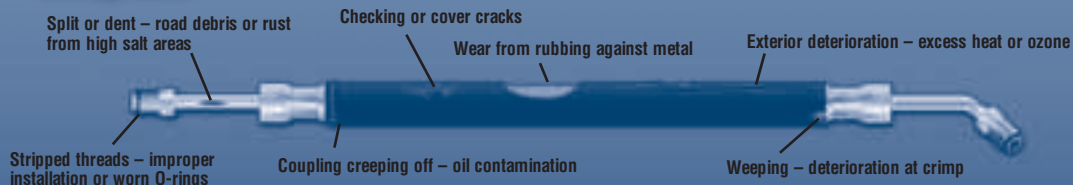

- Flush transmission/change the filter and replace fluids.
- Replace Quick Connect Fittings: Do not reuse the O-rings as they can shrink, become hard or brittle and may not seal properly with the new line.
- Take note of the color and odor of fluid prior to flushing. If color is dark or brown and there is a burnt odor, this may be an indication of worn, burnt or damaged plates.

Leaking transmission fluid will typically have a red tint

### TOC – Transmission Oil Cooler Lines

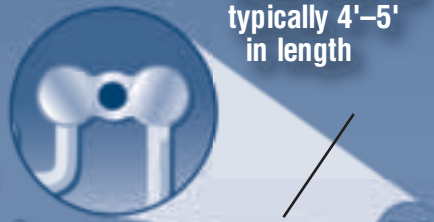

- The routing of transmission lines will go from the radiator into the transmission bell housing.
- Transmission lines can have both rubber and coupled steel tubing in addition to only steel tubing lines.

# IS LEAKING?

## ENGINE OIL COOLER LINE

Dual-block fittings can only be found on engine oil cooler lines

Engine oil cooler lines are typically 4'-5' in length

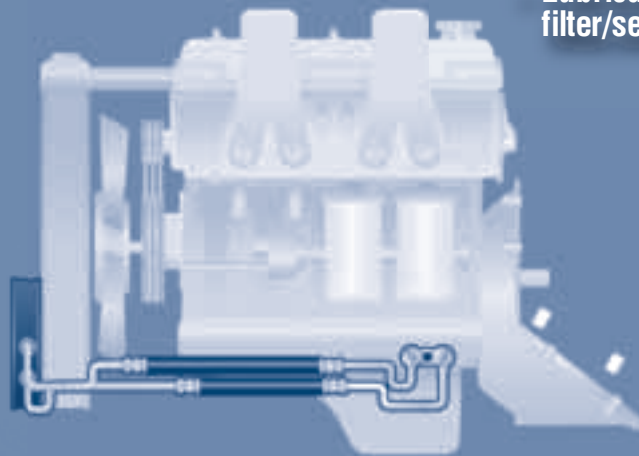

Hose diameter is typically 1/2" or 5/8"

Leaking engine oil will typically be brown or black in color and may have a burnt odor

### Tech Tips:

Routing of your hydraulic line assembly is critical due to many factors including road vibration and heat dissipation. Install an assembly that follows the OEM routing. Not doing so can cause kinking, pinching and premature failure.

Upon completing an installation, it is always wise to clean and dry the affected areas to show the customer the leak no longer exists. Leaving it may cause your customer to question the repair.

### EOC – Engine Oil Cooler Lines

- The routing of engine oil cooler lines will also go from the radiator, but will be routed into the engine casing.
- All engine oil cooler lines have some portion of rubber in them.

### Installation Tips

#### EOC – Engine Oil Cooler Lines

- When Changing:
  - Change oil and filter.
  - Replace Quick Connect Fittings: Do not reuse the O-rings as they can shrink, become hard or brittle and may not seal properly with the new line.
  - Remember to tighten oil drain plugs and filter.
  - Check for metal chips on oil drain plug.
  - Lubricate seal or filter/seal could tear.

Illustrations

Most problems in transmissions and engines are the result of leaking hoses, fittings, gaskets and O-rings. Repairing or adjusting these problems does not involve extremely complicated procedures.

In the composite drawing and in the table below, various types of transmission and engine oil cooler assembly problems are illustrated.

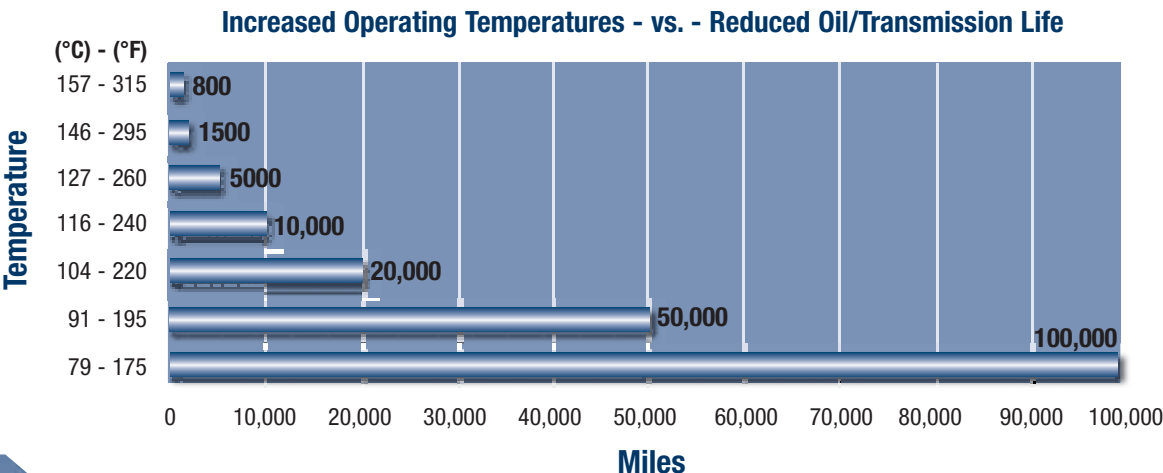

Because of exposure to underhood heat, high fluid temperatures, ozone, flexing, abrasion, grease and oil, assemblies and hoses should be inspected and replaced, if necessary, to ensure safe operation.

Symptom	Cause
Oil "weeping" from hose and coupling	Deterioration of hose at crimp due to excessive heat
Exterior deterioration	Oil contamination of hose Prolonged exposure to ozone Excess heat Wear from rubbing Checking (cover cracks) Road debris
Coupling separation	Oil contamination Excess heat Hose reinforcement separation
Split or dented tubing	Road debris Rust due to environments with high salt concentrations Accidents
Leaking at thread configuration	Improper installation Stripped threads Worn O-rings or gaskets

**Preventive Maintenance Tip:** Low fluid levels can seriously damage the transmission, so it's wise to check it when checking engine oil. A drop in transmission fluid level indicates there might be a leak in the transmission oil cooler line.

Overheating will also cause a drop in fluid levels. See the chart below for how much a 20°F increase in operating temperatures can reduce oil and transmission life.
